

Carevo Security and Compliance One-Pager

Carevo helps insurers and healthcare facilities route members to the right level of care while preserving an auditable safety trace. The product combines patient intake with Carevo AuditOS, an operations layer for route safety, consent, decision traces, and audit readiness.

What matters	Carevo posture
AI safety	Emergency screens first. LLM extracts and phrases only. Deterministic engine chooses care level.
Security controls	HTTPS/HSTS, CSP/security headers, no client AI keys, validation, rate limits, admin key gates, no-store APIs.
Data minimization	No required accounts or identifiers in the public demo. Optional research sharing only after consent and with deletion code.
Compliance status	HIPAA-aware and SOC 2-readying. Not claiming HIPAA, SOC 2, or ISO 27001 certification today.
Before PHI production	BAAs, encrypted durable storage, access controls, risk analysis, policies, incident response, vendor review, and pen test.

Plain-English Buyer Answer

Carevo is designed for auditable healthcare navigation, but we are not overstating certification status. For pilots, we can run with limited or no real PHI while showing the safety architecture, route trace, and operations workflow. For production PHI use, we will complete BAAs, risk analysis, access controls, durable encrypted storage, and evidence collection before launch.
